

iRIS CLEAR

Clause Locator & Executive Agreement Review

Contract intelligence for executed agreements — every clause located, checked and traceable to the page it came from.

User Manual

A practical guide to uploading contracts, reviewing extracted clauses, searching the repository and exporting results.

SECTION 1

Product Overview & Getting Started

iRIS CLEAR is the contract intelligence workspace from Iris Regtech Solution. It reads executed agreements, locates the clauses inside them, checks each against the clause set its agreement type should contain, and presents the result as a reviewable record — with the page every finding came from.

What it is for

Signed agreements usually end up in shared folders. The obligations, renewal deadlines and liability exposure inside them only surface when somebody opens the file and reads it — which is slow, uneven and impossible to do across a whole portfolio at once. iRIS CLEAR turns that library into a searchable register: it extracts the terms, flags what is risky or missing, and keeps a link back to the source text.

Key capabilities

Capability	What it gives you
Automated extraction	Clauses, parties, obligations, key dates and risks are pulled from each uploaded document.
Clause master checks	Every document is measured against the clauses its agreement type should contain; absences are flagged.
Evidence-linked review	Each extracted item opens the source page with the passage outlined, and can be approved, corrected or rejected.
Search and Copilot	Search in plain language or by exact wording, and ask questions answered only from your contracts, with a numbered citation behind every claim.
Portfolio, Alerts and Exports	Obligations, key dates, risks and counterparties across the estate; alerts for expiries and deadlines; Excel workbooks of exactly the view on screen.

Getting started

Before you begin

- A current desktop browser (Chrome, Edge or Firefox).
- An account created for you by an administrator.
- Membership of at least one **Business Unit**.

Signing in and out

1. Open the address supplied by your administrator.
2. Enter your **Email** and **Password** and select **Sign in**. Where your organisation has enabled it, **Sign in with Microsoft** is offered instead.
3. At a first sign-in you are asked to change the temporary password: enter it, then a new one of at least 8 characters, and confirm.
4. To leave, open the circular initials button at the top right and choose **Sign out**. The same menu switches between **Light** and **Dark**.

The Business Unit is the boundary

Every contract belongs to exactly one Business Unit, and you only ever see the units you are a member of. The selector in the top bar narrows that view further; it can never widen it. Check it before reading any figure — it decides what every number on screen counts.

User roles

Capability	Admin	Contract Manager	Reviewer	Viewer
View contracts, portfolio, alerts; search, Copilot, download	✓	✓	✓	✓
Upload contracts	—	✓	✓	—
Approve, correct or reject extracted clauses	✓	✓	✓	—
Create exports	✓	✓	✓	—
Retry, cancel or reprocess a document	✓	✓	—	—
Manage Business Unit members; view the Activity log	✓	✓	—	—
Manage users, Business Units and Clause Master	✓	—	—	—

Roles are granted per Business Unit, so the same person can be a Contract Manager in one and a Viewer in another. Administrators deliberately cannot upload contracts — that is project-member work.

SECTION 2

Dashboard & Navigation

The Dashboard is the landing screen and the daily starting point: it answers “what needs my attention in this Business Unit today”. Every headline figure is clickable and opens the contracts that produced it, so a number is never a dead end.

Interface layout — sidebar, top bar and the Dashboard content area. Figures in this manual are layout diagrams, not screen captures.

Headline figures

Tile	What it counts
Contracts	Everything in view.
Expiring in 90 days	Contracts whose end date falls inside the window.
High risk	Contracts scored in the high risk band.
Unlimited liability	No liability cap, or carve-outs that defeat it.
Missing mandatory clauses	Expected clauses that were not found.
Needs review	Extractions waiting on a human decision.
Clauses extracted	Total clauses located across the view.

Panels below the figures

- **Needs attention** — a ribbon of the non-zero action figures; select one to jump straight to those contracts.
- **Renewal watchlist** — closest expiry first, with the notice deadline and whether the contract auto-renews.
- **Agreement types** — what kinds of contract the repository holds.
- **Risk distribution** — contracts by risk band.
- **Contract status** — how much of the estate has finished processing.

Moving between modules

Screen	Purpose
Dashboard	Headline figures and what needs attention.
Upload	Add documents to a Business Unit.
Contracts	The contract register, filtered and sorted.
Portfolio	The same corpus by obligation, date, risk and counterparty.
Search	Find passages by meaning or exact wording.
Copilot	Ask questions across the repository.
Processing	Watch documents move through the six stages.

Screen	Purpose
Clause Coverage	How much of each type's expected clause set was found.
Alerts	Expiries, notice windows and obligation deadlines.
Exports	Workbooks you have requested.
Business Unit · Admin	Create Business Units and manage their members.
Users · Admin	Create accounts and assign them to Business Units.
Clause Master · Admin	Which clauses each agreement type is checked for.
Activity	Who did what, and when.

The sidebar shows only the screens your role can use, so an administrator sees the Administration group and no Upload link, while a member sees the reverse. Collapse the sidebar with the chevron at its foot to widen the working area.

SECTION 3

Contracts — Adding Documents and Working the Register

3.1 Upload contracts

Purpose. Bring executed agreements into a Business Unit. Processing starts on its own the moment a file is accepted — there is no separate “process” step to remember.

How to use

1. Select **Upload** in the sidebar.
2. Under **Destination**, choose the **Project** these documents join. This is required, and it decides who can see them.
3. Drag files onto the drop area, or select it to browse. Several at once is fine.
4. Select **Upload *n* files**.
5. When the list shows the files as accepted, select **Watch processing** to follow them.

Key actions

Action	Description
Choose destination	Sets the Business Unit the documents belong to.
Add files	PDF, Word (.doc, .docx) or a .zip of them, up to 50 MB each.
Upload	Stores the files and queues them for processing.
Clear list	Empties the local list; it does not delete anything uploaded.
Open	Opens a finished file, or the contract a duplicate matched.

Expected result. Each row turns green and reads *Uploaded — processing queued*. A ZIP expands into one contract per document inside it. A file already in the repository is marked as a duplicate and links to the existing contract rather than creating a second copy. Word documents are converted to PDF automatically, because evidence highlighting needs a page to point at.

Before you upload

Check the Project field first. A contract placed in the wrong Business Unit is visible to the wrong people, and moving it afterwards is not a self-service action. Administrators do not see this screen at all — uploading is done by Contract Managers and Reviewers.

3.2 The Contracts register

Purpose. One row per contract, with the status, risk, value and expiry that were extracted from it. This is where most reviewing days start and where exports are produced.

How to use

1. Select **Contracts** in the sidebar.
2. Type in the search box to narrow by title, party or file name.
3. Refine with the **Status** and **Risk** chips and the three toggles.
4. Sort with the dropdown, or by selecting any column heading.
5. Select a row to open the contract.

Key actions

Action	Description
Search	Matches title, counterparty and original file name.
Filter	Status and risk chips; toggles for Needs review, Unlimited liability and Missing mandatory clauses.
Sort	Newest, oldest, highest risk, expiring soonest or title A–Z.
Export	Builds an Excel workbook of exactly this filtered view.
Clear all	Removes every active filter at once.

Expected result. The strip above the table reports the total, how many filters are active and how many rows of the total are showing. Filters are held in the page address, so a filtered view can be bookmarked or sent to a colleague and will open the same way for them.

SECTION 4

The Contract Review Workspace

Purpose. Read what was extracted from one agreement beside the document it came from. The left pane holds the extracted record; the right pane is the source document. Selecting **Evidence** on any item moves the viewer to that page and outlines the passage.

Interface layout — the extracted record (left) beside the source document with the cited passage outlined (right).

How to use

1. Open a contract from the register, the Dashboard or a search result.
2. Work through the tabs on the left pane.
3. Select **Evidence** on a clause, risk or obligation to see it in the document.
4. Correct the text or fields if the extraction is wrong, then select **Approve**; select **Reject** if the item does not belong.
5. Use **Export** to download this contract's extracted record as a CSV report, or **Copilot** to ask questions about this agreement alone.

What each tab holds

Tab	Contents
Overview	Attention items, summary, commercial terms, source document and downloads.
Risks	Identified risks with severity and evidence.
Obligations	Who owes what, and by when.
Key dates	Effective, execution, expiry and notice dates.
Parties	The counterparties named in the agreement.
Clause tabs	One per clause category. A mandatory clause that was not found still gets a tab, marked as missing.
Graph	How this contract's extracted facts relate to one another.
Processing	Every stage this document ran, with timings and any error.

Reviewing an extraction

Action	Description
Evidence	Jumps the viewer to the page and outlines the passage.
Approve	Accepts the item. If you edited it first, it is recorded as a correction, not an overwrite.
Reject	Marks the item as not applicable to this contract.
Download	The processed PDF, and the original file where it was converted.

Reading the badges

- **Page *n*** — where in the document the item was found.
- **Confidence** — how sure the extraction is. Green is high, amber is worth checking, red should be verified before you rely on it.
- **Needs review** — the contract carries at least one item a person has not yet decided on; the banner names the reasons.
- **Missing** — a clause the agreement type should contain was not located. Each absence contributes to the risk score.

Always verify what matters against the source

Extracted clauses, summaries, risk scores and Copilot answers are produced automatically and are not guaranteed to be correct or complete. Before relying on any finding for a decision, an obligation or external advice, open its **Evidence** and read the passage in the document itself. The source document is the record; the extraction is a fast route to it.

SECTION 5

Finding Answers — Search and Copilot

5.1 Search

Purpose. Find the passages that answer a question, across every contract in view. Search returns the matching contracts and the passages themselves, so you can judge relevance before opening anything.

How to use

1. Select **Search** in the sidebar.
2. Type a question or a phrase, or pick one of the suggested examples.
3. Choose a mode, then select **Search**.
4. Open **Retrieval plan** if the results look wrong — it shows how the question was read.
5. Select a result to open that contract at the passage.

Search modes

Mode	Use it when
Hybrid	The default. Fuses meaning and exact wording; best for most questions.
Semantic	You want paraphrases — the idea, however it is worded.
Keyword	You need a literal phrase, a defined term or a reference number.

Expected result. A list of matching contracts, then the passages, each showing the contract, page and how it was retrieved. When nothing matches, the retrieval plan is shown instead of an empty screen — rephrasing, or switching to Keyword, usually fixes it.

5.2 Copilot

Purpose. Ask a question in plain language and get a written answer assembled from your contracts, with a numbered citation behind every claim. Copilot answers only from the documents in view; when they do not say, it says so rather than guessing.

How to use

1. Select **Copilot**, or open the **Copilot** button on a contract to ask about that agreement alone.
2. Type a question, or select one of the suggested starters.
3. Optionally choose an answer format.
4. Select **Ask**. The answer streams in; **Stop** ends it early.
5. Select any citation to open the contract at the cited page.

Past conversations are listed alongside, so a thread can be reopened and followed up.

Answer formats

Format	Shape of the answer
Automatic	Copilot chooses to suit the question.
Executive summary	A short narrative for a non-specialist reader.
Risk report	Exposures, grouped and ranked.
Action items	What has to be done, by whom.
Timeline	Dates and deadlines in order.

Three answers that are not errors

What you see	What it means	What to do
"The supplied contracts do not say..."	The documents in view contain no evidence for the question.	Widen the Business Unit selector, or confirm the relevant contract has finished processing.
This answer needs review	A citation could not be tied back to the retrieved evidence.	Read the answer as a lead only, and verify it in the source document before relying on it.
No citations	An answer was produced without evidence attached to it.	Treat it as unverified. Re-ask more specifically, or search for the passage directly.

Copilot and Search read only the contracts that have finished processing in the Business Units you belong to. A contract still in Processing is not yet searchable, and its clauses are not yet part of any answer.

SECTION 6

Portfolio, Clause Coverage, Alerts and Processing

These four screens read the same corpus from four different angles: by commitment, by completeness, by deadline, and by what the platform is currently doing to each document.

6.1 Portfolio — the cross-contract registers

Purpose. Everything the estate commits you to, listed independently of which document it came from. Four tabs: **Obligations**, **Key dates**, **Risks** and **Counterparties**.

How to use. Select **Portfolio**, choose a tab, filter and sort, then page through the list. Every row links back to the contract it came from.

Expected result. A working list — obligations with their owner and due date, key dates in order, risks by severity, counterparties with the contracts they appear in.

Use this when the question is “what is due next month” rather than “what does this contract say”.

6.2 Clause Coverage — how complete the extraction is

Purpose. How much of each document type's expected clause set was actually located, and which clauses were never found in any document of that type.

How to use. Select **Clause Coverage** and read the four figures — **Documents**, **Clauses located**, **Average coverage** and **Embedded** — then work down the tables.

Expected result. A per-document coverage percentage, a count of the documents each clause type was found in, and a **Never located** list — clauses the taxonomy expects that no document has yet produced.

A low coverage figure is a prompt to check the document itself, not proof that a clause is absent.

6.3 Alerts — deadlines and exposures

Alert type	Raised when
Contract expiring	The end date falls inside the warning window.
Auto renewal notice	A notice deadline is approaching on an auto-renewing contract.
Obligation due	An obligation's due date is near, or it has been missed.
High risk	The risk score reaches the configured threshold.
Missing mandatory clause	Expected clauses were not found in a document.
Review required	Items are waiting on a human decision.
Processing failed	A document could not be processed.

How to use

1. Select **Alerts**. Open alerts show first, most severe at the top.
2. Use the status chips to include **Acknowledged**, **Resolved** or **Dismissed**.
3. Select **Acknowledge** to take ownership, **Resolve** once handled, or **Dismiss** if it does not apply. A note can be added.
4. Administrators can open the **Rules** tab to set the warning windows, thresholds and severities each alert type uses.

6.4 Processing — what the platform is doing

Purpose. Follow each document through the six stages of processing, and act when one fails. Every stage checkpoints, so a retry resumes from the failed stage rather than starting again.

How to use. Select **Processing**, filter by state if the list is long, and expand a document to see its stage table — stage, status, attempt, duration and notes.

The figures at the top of the screen — **In flight**, **Stalled**, **Dead letter** and **Stages registered** — describe the platform rather than any one document. A non-zero **Dead letter** count, or a **Stages registered** figure below the full set, is a platform issue: report it to your administrator rather than retrying documents individually.

Action	Description
Retry	Offered when a retry could plausibly help; resumes from the failing stage.
Cancel	Stops a run that is still in progress.
Reprocess from	Re-runs from a chosen stage onwards — useful after a Clause Master change.

SECTION 7

End-to-End Workflow — From Signed PDF to Exported Register

This is the journey the product is built around. It begins with a signed agreement on disk and ends with a reviewed, exportable record that anyone can trace back to the page it came from.

The primary workflow. Stages 1–4 bring a document in; stages 5–8 turn it into a decision you can defend.

Stages 1 to 4 — getting the document in

Stage	Your action	What the system does	Expected result
1. Sign in	Enter your email and password, or use Sign in with Microsoft. Set the Business Unit in the top bar.	Restores your session and limits everything on screen to the Business Units you belong to.	The Dashboard opens, showing figures for the selected Business Unit.
2. Upload	Select Upload , choose the destination project, add the files and select Upload .	Checks the file type and size, stores it, converts Word to PDF where needed, and queues it. A ZIP becomes one contract per document; a repeat file is flagged as a duplicate.	Each row reads <i>Uploaded — processing queued</i> , and Watch processing appears.
3. Processing	Select Watch processing , or open Processing later. No action is needed while it runs.	Runs the six stages in order, checkpointing each one. The contract's status moves from Uploaded to Processing and then to Ready or Needs review .	A progress bar with the current stage; the document becomes readable before extraction finishes.
4. Open the contract	Select the contract from Processing , the register or the Dashboard.	Loads the extracted record beside the source document.	The review workspace, with tabs for risks, obligations, key dates, parties and each clause category.

What happens during processing

The six stages below are what the **Processing** screen names. You do not start them — they run in order automatically — but knowing what each one produces makes a failure much easier to interpret.

Stage	What it produces	If it fails
Validation	Confirms the file really is a supported document and is readable.	The file is corrupt, empty or not the type its name claims. Re-save it and upload again.
Parser	Reads the pages, including scanned ones, and recovers the text and layout.	The scan may be too poor to read. Try a higher-quality copy of the document.
Clause Detection	Identifies the agreement type and locates the clauses it should contain.	Usually recoverable — select Retry , which resumes from this stage.
Extraction	Turns the located text into clauses, parties, obligations, risks and key dates.	Retry. If it fails repeatedly, report the document to your administrator.
Embedding	Makes the document's text searchable by meaning.	The contract is readable but will not appear in semantic search or Copilot answers until this succeeds.
Indexing	Links the extracted facts to one another so related items can be found together.	Search still works; the relationship graph on the contract will be thinner.

SECTION 7 · CONTINUED

End-to-End Workflow — Review, Verify and Export

Stage	Your action	What the system does	Expected result
5. Review	Work the tabs. Select Evidence on each material clause, correct anything wrong, then Approve or Reject .	Moves the viewer to the cited page and outlines the passage. An edited item is recorded as a correction against the original rather than replacing it.	The item shows its decision, and the Needs review banner clears once nothing is outstanding.
6. Search or ask	Use Search for passages, or Copilot for a written answer. Use the Copilot button on a contract to confine the question to that agreement.	Retrieves the passages that match, and assembles an answer citing them.	Results with contract and page, or an answer with numbered citations that open the cited page.
7. Verify	Open the citation or the evidence for anything you intend to act on.	Opens the source document at the cited page with the passage outlined.	You have read the actual contract wording, not only the extracted summary of it.
8. Export	Set the filters you want on Contracts , select Export , choose the record types and confirm.	Builds an Excel workbook of exactly that filtered view, one worksheet per record type, outside your session.	The job appears on Exports as Queued , then Running , then Completed with a download link.

Following a document through processing

States you will see on the Processing screen

State	Meaning
Queued	Waiting for capacity.
Validating · Parsing	Reading the file and its pages.
AI extraction	Locating clauses and extracting the terms.
Embedding · Indexing	Making the document searchable.
Ready	Every stage completed.
Retrying · Failed	A stage is being reattempted, or could not be recovered.
Cancelled · Paused	Stopped by a person.

While a document is processing

- The screen updates on its own — do not refresh, and do not upload the file again.
- The source document is readable as soon as parsing finishes; the extracted tabs fill in later.
- A failed stage names the error. **Retry** resumes from that stage; earlier stages are not repeated.
- **Reprocess from** re-runs from a stage you choose — use it after a Clause Master change.

Before you call a contract done

Check	Where to confirm it
The contract reads Ready , not Needs review or Failed .	Contracts, or the banner at the top of the contract.
No mandatory clause is still flagged as missing.	The clause tabs, and Attention on Overview.
Every low-confidence item you rely on has been read in the document.	The confidence badge, then Evidence .
Expiry, notice period and auto-renewal are right, and anything requiring action has an owner.	Overview > Commercial terms, then Portfolio > Obligations and Alerts.

Why this step exists

The platform makes a contract reviewable in minutes; it does not replace the review. Extraction is confident on well-structured agreements and less so on poor scans or unusual drafting.

The checks opposite separate “processing completed” from “someone has read it”, and are what makes the register safe to circulate and rely on.

The workflow is not finished at “Completed”

An export is a snapshot of extracted data at the moment it was built. Where the workbook will be circulated, relied on in negotiation or used as the basis for advice, verify the material rows against the source documents first — the platform records confidence and evidence precisely so that this check takes seconds rather than an afternoon.

SECTION 8

Search, Review, Export & Administration — Reference

8.1 Searching, filtering and sorting

Screen	Search	Filters	Sort & paging
Contracts	Title, counterparty or file name.	Status and risk chips; Needs review, Unlimited liability, Missing mandatory clauses.	Five sort orders, or select any column heading. Paged.
Portfolio	Within the selected tab.	Per-tab filters on each register.	Paged.
Search	The question or phrase itself.	Hybrid, Semantic or Keyword mode.	Ranked by relevance.
Alerts · Exports · Activity	—	Alert status; export status; action type and outcome.	Most severe or newest first. Paged.

8.2 Reviewing and verifying

Action	Where	Effect
Evidence	Any clause, risk or obligation	Opens the source page with the passage outlined.
Approve	Clause card	Accepts the item; an edit is recorded as a correction.
Reject	Clause card	Marks the item as not applicable.
Citation	Copilot answer	Opens the cited contract at the cited page.

Download and read the source

- **Download document** on the Overview tab gives the processed PDF; where a Word file was converted, **Download original** gives the file as uploaded.
- Evidence is positioned against the converted PDF, so that is what the viewer shows.
- Page controls and zoom sit above the document; pages carrying evidence are indicated.

8.3 Exports

From the register — an Excel workbook

1. Set the filters you want on **Contracts**, then select **Export**.
2. Choose the record types to include — **Contracts, Clauses, Obligations, Risks, Key dates, Parties**.
3. Confirm. The workbook is built outside your session, so you can carry on working.
4. Collect it from **Exports** when it reads **Completed**.

What you get

- An **Excel workbook (.xlsx)** of exactly the filtered view, one worksheet per record type.
- Files are kept for a limited window shown on the export dialog, then removed. Download promptly; an expired job must be run again. **Exports** only ever lists your own exports.
- **Export** on one contract is different: it downloads a **CSV report** of that contract straight away and never reaches the Exports screen.

8.4 Administration

Screen	Who	What it does
Business Unit	Admin	Create a Business Unit with a name, optional client and description; add, edit and remove members, each with a role.
Users	Admin	Create an account with a full name and email and assign it to Business Units with a role. The starting password is set by the platform and must be changed at first sign-in — no password is typed here.
Clause Master	Admin	Define which clauses each agreement type is checked for. Changes apply to new uploads; already-processed contracts keep what they were extracted with, so use Reprocess from to re-run them.
Alerts · Rules	Admin	Set the warning windows, thresholds and severity for each alert type, and switch a type off.
Activity	Admin, Contract Manager	Who did what and when, filtered by action and outcome. Scoped to the Business Units you can see.

SECTION 9

Statuses, Troubleshooting & Frequently Asked Questions

9.1 Contract statuses

Status	Meaning	Recommended action
Uploaded	Stored and queued; processing has not started.	Wait.
Processing	Moving through the six stages.	Wait — the document is already readable.
Ready	Processing finished; nothing is outstanding.	Review the extracted record.
Needs review	Finished, but items await a human decision.	Open the contract and work through the flagged items.
Failed	A stage did not complete.	Open the Processing tab for the failing stage and error, then Retry .
Conversion failed	Stored, but could not be turned into a PDF, so processing never started.	Upload a different copy of the document; a retry will not help.
Archived	Retained for reference, kept out of the working list.	Include the Archived chip on Contracts to see these.

9.2 Export statuses

Status	Meaning
Queued	Requested, not started.
Running	The workbook is being built.
Completed	Ready to download.
Failed	Could not be built — run it again.
Expired	Past its retention window; run it again.

9.3 Alert statuses

Status	Meaning
Open	Raised and not yet actioned.
Acknowledged	Someone has taken ownership of it.
Resolved	The underlying issue has been handled.
Dismissed	Judged not to apply to this contract.

The states a document passes through while it is being processed are on page 9.

9.4 Common issues

Issue	Likely cause	What to do
Cannot sign in	Wrong credentials, or the account does not exist yet.	Re-enter your email and password; use Sign in with Microsoft where your organisation offers it. Otherwise ask an administrator to check the account.
A file will not upload	Unsupported type, or larger than 50 MB.	Use PDF, .doc, .docx or a .zip of them, under 50 MB each. Re-save or split an oversized scan.
A contract is stuck on Processing	It is queued behind other work, or a stage failed.	Open Processing . If a stage shows an error, select Retry — it resumes rather than restarts.
No contracts, or empty figures	The Business Unit selector is narrowed, or filters are active.	Set the selector to All my business units and select Clear all on the filters.
Search or Copilot returns nothing	The contracts have not finished processing, or the question was read differently than intended.	Check the contract is Ready , open the Retrieval plan , rephrase, or switch to Keyword .
An export cannot be downloaded	The job expired, or it failed.	Run the export again from the Contracts screen and download it promptly.

9.5 Frequently asked questions

Question	Answer
Can I trust what was extracted?	Treat it as a fast, well-evidenced first pass, not as a legal conclusion. Every item carries a confidence badge and an Evidence link to the exact passage — verify anything material there before relying on it.
Why can I not see the Upload screen?	Uploading requires a Contract Manager or Reviewer role in a Business Unit. Administrators and Viewers do not have it.
Can I move a contract to another Business Unit?	No. The destination is chosen at upload and is the security boundary. Ask an administrator if a document was placed wrongly.
What happens to a Word document?	It is converted to PDF automatically, because evidence highlighting needs a rendered page. Both the processed PDF and the original remain downloadable.
I changed the Clause Master — why did nothing change?	Changes apply to new uploads. Existing contracts keep the clauses they were extracted with; use Reprocess from on the Processing screen to re-run them.

SECTION 10

Quick Reference, Best Practices & About

The workflow at a glance

Where to go for what

If you need to...	Go to
See what needs attention today	Dashboard
Add a signed agreement	Upload
Find one contract	Contracts
See what is due next month	Portfolio › Key dates
Find a specific clause wording	Search › Keyword
Ask a question across the estate	Copilot
Check why a document failed	Processing
See what the extraction missed	Clause Coverage
Act on a deadline	Alerts
Get the data into Excel	Contracts › Export
Add a colleague	Users (Admin)

Best practices

- **Set the Business Unit first.** It decides what every figure on screen counts.
- **Upload to the right project.** The destination is the security boundary and is not a self-service change afterwards.
- **Review before you circulate.** Approve or reject the flagged items so that **Needs review** means something to the next person.
- **Open the Evidence for anything material.** Confidence badges rank the extraction; only the document settles it.
- **Filter, then export.** The workbook is exactly the view on screen — set the filters first and download it promptly.
- **Report platform-level problems.** A non-zero **Dead letter** count is for your administrator, not for individual retries.

About Iris Regtech Solution

Iris Regtech Solution Contract Intelligence Platform

iRIS CLEAR 1.0.0 · User Manual 1.0
21 August 2026

iRIS CLEAR — Clause Locator & Executive Agreement Review — is the contract intelligence platform built by Iris Regtech Solution for teams whose obligations, deadlines and liability sit inside agreements that nobody has time to re-read.

The product's guiding rule is that a finding is only useful if it can be checked. Every clause, risk, obligation and Copilot answer in this manual is presented alongside the document, page and passage it came from, so a reviewer can move from a headline figure to the contract wording in a few seconds — and can say, afterwards, exactly where the answer came from.

For access, roles, Business Unit membership or platform issues, contact your platform administrator.
